

Package ‘lin’

October 24, 2020

Type Package

Title Jennifer Lin's Collection of Functions

Version 0.1.0

Description These are functions that I use often in my work. May not be useful for general use but may be necessary to install if you are collaborating with me or interacting my R code.

ggLin	<i>Jennifer's ggplot2 Theme</i>
-------	---------------------------------

Description

I find that I am copying and psting the same long command for my favorite theme settings, so I figure I'd write that into this package to simplify the process.

Usage

```
theme_lin(...)
```

Arguments

... Passed to [ggplot2::theme()]

Details

The specifications of this theme is as follows:

```
theme_classic()+
theme(
  plot.title = element_text(hjust = 0.5,size = 24,colour="black"),
  plot.subtitle = element_text(hjust = 0.5,size = 18,colour="black"),
  legend.title = element_text(hjust = 0.5,size = 16,colour="black"),
  plot.caption = element_text(size = 12,colour="black"),
  axis.title = element_text(size = 16,colour="black"),
  axis.text.x = element_text(size = 14,colour="black"),
  axis.text.y = element_text(size = 14,colour="black"),
  legend.title.align = 0.5)
```

Examples

```
library(ggplot2)
ggplot(mtcars, aes(y=mpg, x=disp, color=cyl)) +
  geom_point() +
  theme_lin()
```

Operators	<i>Operators</i>
-----------	------------------

Description

Some useful operators outside of the standard ones in R.

Usage

```
x %nin% y

x %NIN% y

x %IN% y
```

Arguments

x	a vector
y	a vector to match

Examples

```
y = c(3, 4, 5, NA)

# Not In -- and omits NA
y %nin% 3    # FALSE TRUE  TRUE  TRUE
y %NIN% 3    # FALSE TRUE  TRUE   NA

# IN -- Omits NA
```

```
y %in% 3      # TRUE FALSE FALSE FALSE
y %IN% 3      # TRUE FALSE FALSE   NA
```

ReverseCode

*Reverse Coding Variables***Description**

I never actually know how to do them, so I google this every time. Perhaps its time to settle this once and for all.

Usage

```
reverse_code(var)
```

Details

Thanks goes to James Martherus.

Source

<https://github.com/jamesmartherus/martherus>

Examples

```
x1 <- c(1, 2, 3, 4, NA, 5)
reverse_code(x1)      #c(5, 4, 3, 2, NA, 1)

x2 <- c(0, 1, 2, NA, 4, 7)
recode_code(x2)       #c(7, 6, 5, NA, 3, 0)
```

SummaryStats

*Summary Statistics Calculations***Description**

Common functions for calculating central tendencies but with NA parameters set to TRUE unlike the defaults.

Usage

```
modeNA(x)
```

```
meanNA(x)
```

```
wMeanNA(x, w)
```

```
medianNA(x)
```

```
rangeNA(x)
```

```
sdNA(x)
```

```
sumNA(x)
```

```
varNA(x)
```

Arguments

x	a vector
w	a weight variable

Details

Credits to John Bullock for the inspiration. Some of this is from his Bullock package, but others are my own.

Source

<https://github.com/jbullock35/Bullock>

Examples

```
x <- c(1, 1, 2, 3, 5, 8, 13, 21, NA, NA, NA)
w <- c(0, 0, 0, 1, 1, 2, 2, 2, 0, 0, 0)
```

```
# Mode
modeNA(x)      # 1
```

```
# Mean and Weighted Mean
meanNA(x)      # 6.75
wMeanNA(x, w)  # 11.5
```

```
# Median
medianNA(x)    # 4
```

```
# Range
rangeNA(x)     # c(1, 21)
```

```
# Sum
sumNA(x)       # 54
```

```
# Variance and Standard Deviation
varNA(x)
sdNA(x)
```

zscore*z-score Calculations*

Description

Calculating a standard score in Base R can be hard.

Usage

```
zscore(x, mean, sd)
```

Arguments

x	the observation
mean	mean of interest – can be sample or ppulation depending on zscore interest
sd	standard deviation or standard error, depending on context

Examples

```
zscore(10, 15, 2)
```
